techis

FOR LOOP

The most simple and basic loop. Very straightforward to use.

JS index.js

```
const numbers = [22, 34, 46, 58];

for (let i = 0; i < numbers.length; i++) {
    console.log(numbers[i] * 2);
}

// Result: 44 68 92 116
```

techts

WHILE LOOP

It's similar to for loop in terms of complexity and also very straightforward to use.

JS index.js

```
const numbers = [22, 34, 46, 58];
let i = 0;
while (i < numbers.length) {
    console.log(numbers[i] * 2);
    i++;
}

// Result: 44 68 92 116
```

DO-WHILE LOOP

The syntax looks similar to a while loop but the only difference is the code is executed one time before checking the condition.

JS index.js

```
const numbers = [22, 34, 46, 58];
let i = 0;
do {
    console.log(numbers[i] * 2);
    i++;
} while (i < numbers.length)

// Result: 44 68 92 116
```

techts

FOR-OF LOOP

A loop that can be used for arrays to iterate over them without specifying the last limit. This loop ends when reaches the last index of the array.

JS index.js

```
const numbers = [22, 34, 46, 58];

for (const num of numbers) {
    console.log(num * 2);
}

// Result: 44 68 92 116
```

techts

FOR-IN LOOP

Similar to for-of-loop but it's used on JavaScript objects.

techts

MAP LOOP

An ES6 approach to iterate over an array and store the result in a new variable.

techts

FOR-EACH LOOP

It is also an ES6 approach and is similar to the "map" but it only iterates over an array without making any changes or returning any values. This means you can't tweak the array but you can use the individual indexes' values.

JS index.js

```
numbers.forEach(num => {
    console.log(num * 2);
})

// Result: 44 68 92 116
```
